1 Executive overview

This master package is a **source-aligned UI/UX design reference** for SMART MANAGER ERP. It was prepared from the existing React/Vite client, the authoritative BusinessSphereDashboard.jsx module registry, the current role model, the Settings workspace, the shared design tokens, and the existing server/persistence boundaries. It preserves the application direction rather than replacing the production system.

The package contains **40 dedicated module and cross-cutting surface references**, **18 critical workflow diagrams**, a complete navigation and role map, responsive and accessibility guidance, and a component-level design-system reference. The record values shown inside the mockups are deliberately labelled as illustrative design-reference data; they are not claims about production database values.

1.1 What is verified

The module names, role vocabulary, route structure, Settings capabilities, and design-token direction are grounded in the current repository. The visual mockups are intentionally organized as high-fidelity implementation references: they communicate layout, information hierarchy, states, action placement, and responsive composition without pretending to be captured runtime screenshots. The workflow diagrams express the intended interaction sequence and the required control points for each domain.

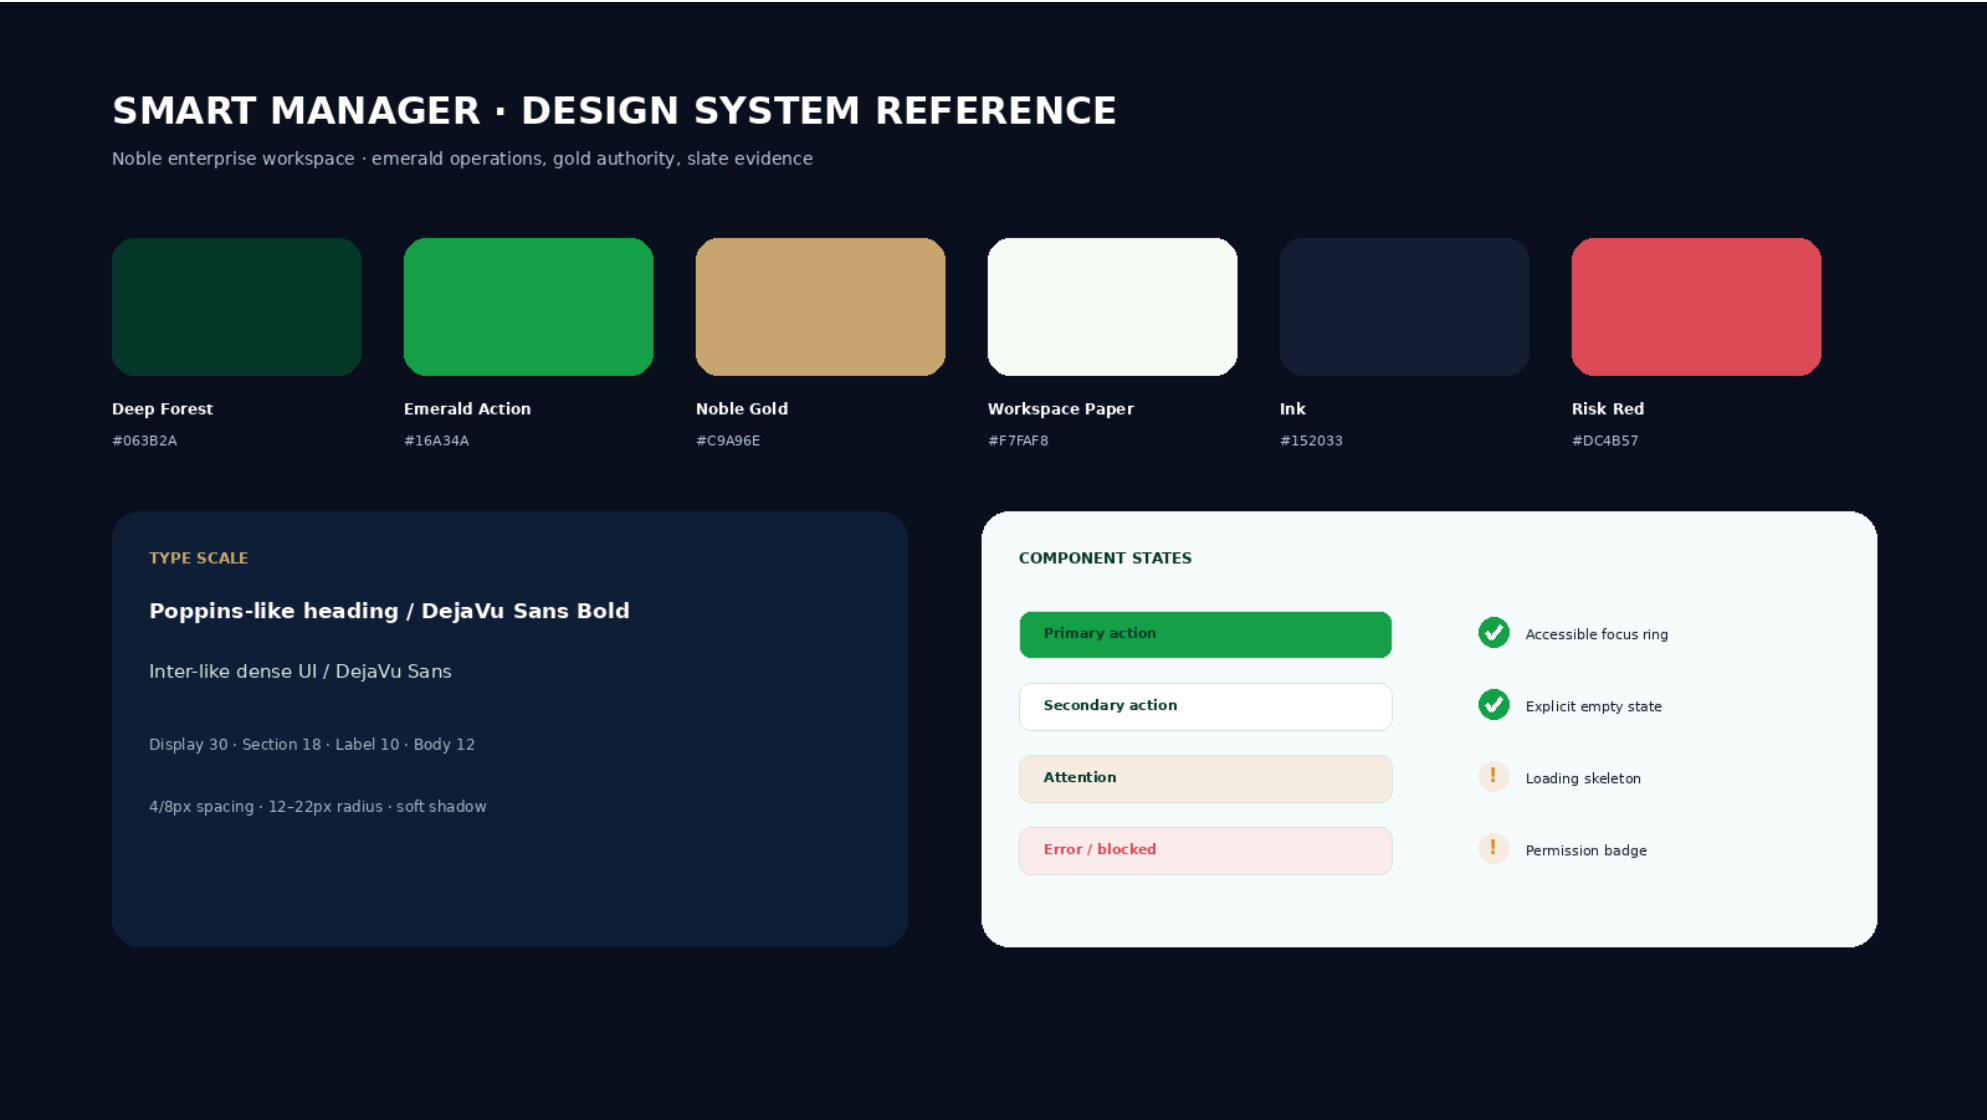

1.2 Architectural design principle

> A reliable enterprise screen should make **context, ownership, status, validation, next action, and evidence** visible at the same time.

This principle is especially important for financial, clinical, identity, cooperative, inventory, and compliance workflows. A successful mutation should not merely disappear into the interface; it should produce a visible result state and a traceable record.

2 Design-system reference

Emerald operations · noble gold authority · slate evidence · paper workspace

The visual system uses deep forest green for navigation and trusted workspace framing, emerald for primary actions and healthy states, noble gold for authority and highlighted controls, paper-white surfaces for working content, slate for secondary information, and red/amber for explicit exceptions. Headings use a Poppins-like display treatment and dense UI text uses an Inter-like sans-serif treatment. Spacing follows the existing 4/8px logic with moderate radii, compact cards, and restrained shadows.

3 Navigation architecture

Global context, role-aware navigation, local workspace, and record-level evidence

The application information architecture follows a stable hierarchy: **public entry** → **authentication/onboarding** → **tenant and branch context** → **module navigation** → **local workspace tabs** → **record detail** → **confirmation/result**. The current company and active branch must remain visible. The global shell should not change its meaning when the user moves between Finance, HR, Healthcare, Banking & MFI, VICOBA/SACCOS, or industry workspaces.

On desktop, the shell supports a persistent sidebar, command palette, global search, notifications, profile, and contextual breadcrumbs. On tablet, secondary actions move into drawers and the module navigation can collapse. On mobile, the sidebar becomes a bottom navigation plus a slide-over module drawer. Dense tables become intentional scroll regions or cards; typography is not compressed below readability.

| Navigation level | Responsibility | Design rule | |—|—| | Global shell | Tenant, branch, role, search, notifications, profile | Never hide company, branch, currency, or current role context. | | Module | Domain command center | One clear primary action and one visible health/status summary. | | Local view | List, board, timeline, or report | Preserve filters and return paths. | | Record | Detail, form, approval, evidence | Show identity, status, owner, audit, and related records together. | | Result | Success, error, pending, restricted | Explain what happened, what did not change, and the next safe action. |

4 Role and permission experience

The module catalog is not an access grant; the role state must be visible

The source role model includes executive, department-head, financial-services, property, healthcare, education, front-line, auditor, employee, customer, supplier, and other external or self-service roles. The design should expose the role context and show permission states honestly. A module visible in the catalog does not imply that a user may view or mutate every record inside it.

| Role pattern | Experience contract | |—|—| | Owner / administrator | Configuration and evidence controls are visible; destructive and financial actions still require confirmation and audit. | | Auditor | Broad read access and evidence export; no create, edit, or delete affordances. | | Department head | Broad oversight with focused primary workspaces and governed actions. | | Front-line operator | Fast task execution, minimal navigation, clear confirmation, and exception recovery. | | Employee / self-service | Own-record workflows only; no organization-wide operational tables. | | Restricted / unavailable | Show the missing permission or escalation path; do not present authorization failure as an empty dataset. |

5 State, form, and component contract

Every async surface must communicate what the system knows

Each query or mutation surface should define loading, empty, success, error, restricted, pending, and stale-data states. Forms should validate required values inline, preserve unsaved changes, prevent double submission, and show a confirmation step before high-impact writes. Financial and clinical actions need a visible reference, owner, resulting status, and audit affordance.

The shared component vocabulary is intentionally compact: command header, KPI card, status badge, filter strip, data table, board/timeline, detail drawer, confirmation dialog, toast, empty-state panel, skeleton, result banner, and evidence timeline. These components should be composed consistently instead of creating a separate visual language for every module.

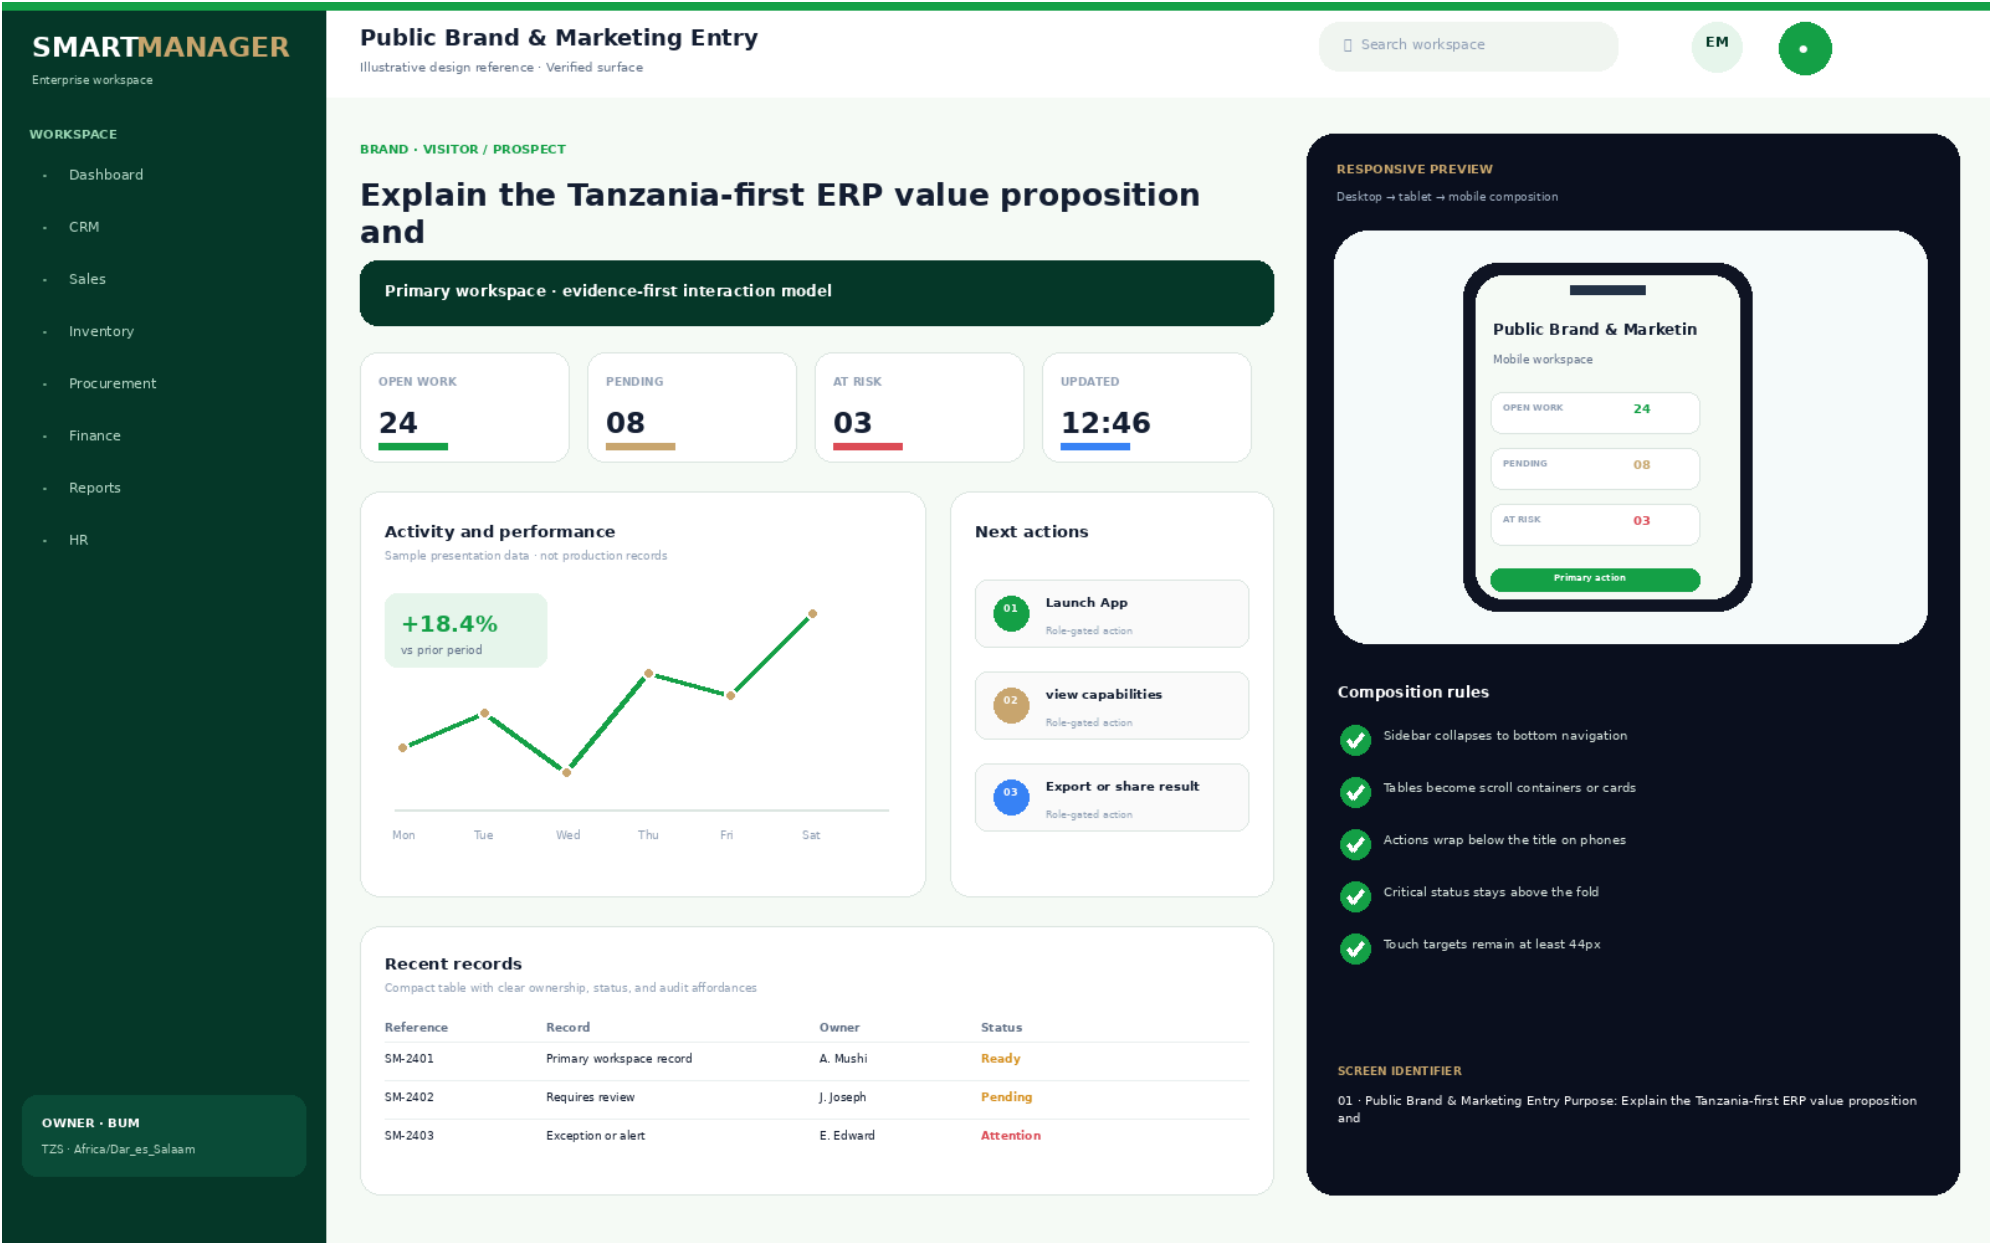

6 Module visual reference gallery

Each major surface has its own standalone implementation reference

The following gallery is the completion-oriented visual index. Each module has a dedicated page so that a grouped overview cannot conceal missing product surfaces. The design reference for every page specifies the intended user, purpose, primary actions, displayed data, fields, connected surfaces, validation behavior, and responsive composition.

7 01 · Public Brand & Marketing Entry

brand · primary role: Visitor / prospect

Design intent. Explain the Tanzania-first ERP value proposition and route the user into the secure workspace.

Workspace composition. Brand mark, capability cards, trust strip, CTA, language selector The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

Interaction contract. Primary actions are **Launch App; view capabilities; contact/support**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Brand promise, module families, compliance positioning Forms center on **Language; workspace entry intent**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. Authentication; Dashboard. Workflow: Discovery → Launch App → Auth Gateway.

8 02 · Authentication & Secure Onboarding

brand · primary role: Visitor / owner / invited user

02 · Authentication & Secure Onboarding Purpose: Authenticate safely and guide new organizations

Design intent. Authenticate safely and guide new organizations through setup or joining.

Workspace composition. Login form, sign-up wizard, recovery, OAuth/passkey options, progress indicator The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

Interaction contract. Primary actions are **Sign in; create company; join company; recover access**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Identity, company, role, verification state Forms center on **Email; password; company name; country; industry; invite code**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. Brand Entry; Settings; Employee Portal. Workflow: Entry → Credentials → Validation → Verification → Workspace.

SCREEN IDENTIFIER

10 · Procurement & Vendor Management Purpose: Control supplier sourcing, approvals, orders,

Design intent. Control supplier sourcing, approvals, orders, and vendor settlement evidence.

Workspace composition. Vendor directory, requisition queue, PO builder, approval trail, payment status The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

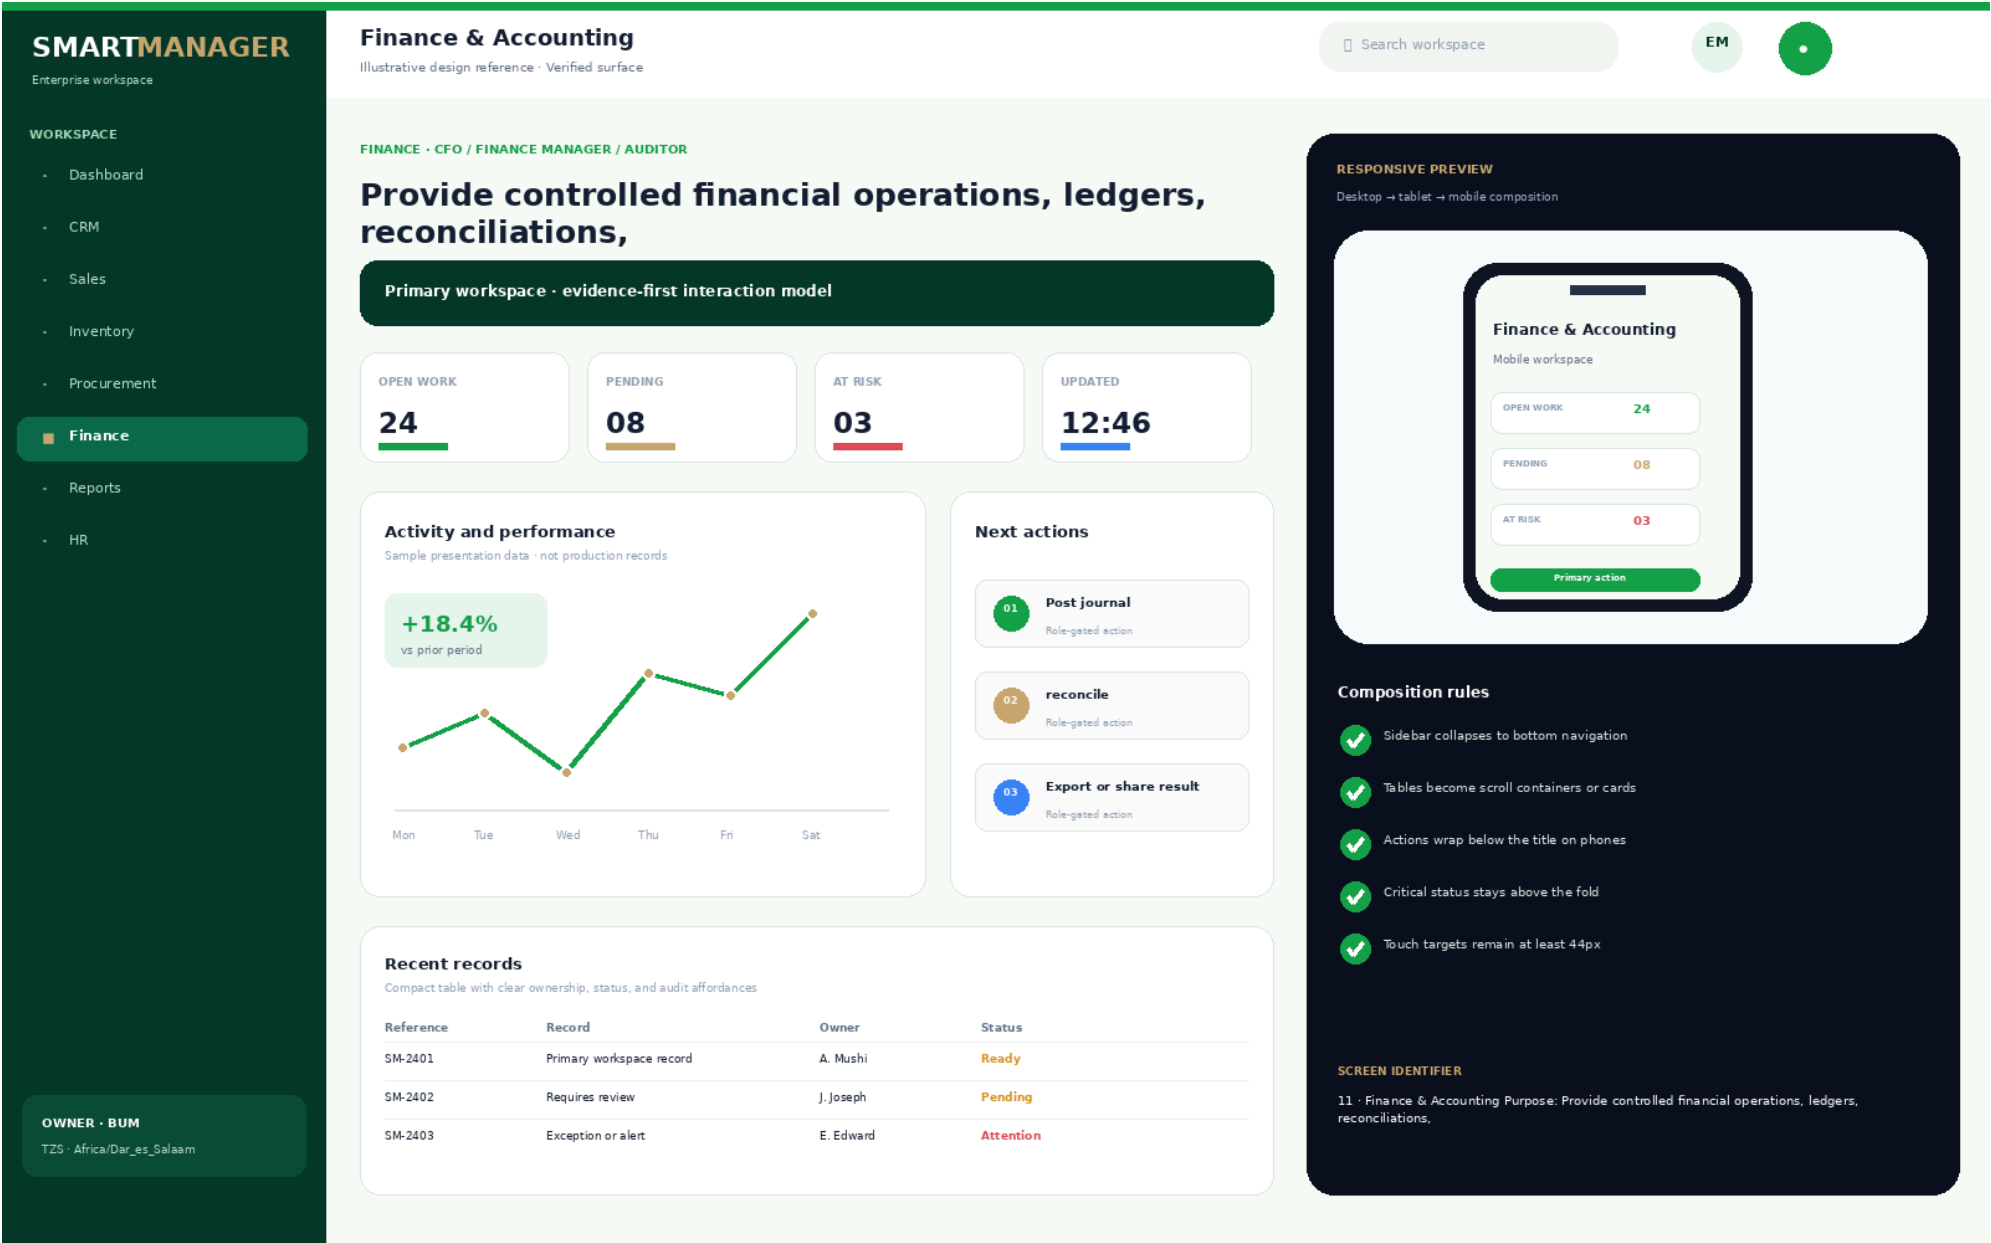

Interaction contract. Primary actions are **Create requisition; approve PO; receive; match invoice**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Vendors, POs, contracts, receipts, approvals, payments Forms center on **Vendor; items; budget; delivery; approver; terms**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. Inventory; Finance; Projects. Workflow: Need → Requisition → Approval → PO → Receipt → Settlement.

17 11 · Finance & Accounting

finance · primary role: CFO / Finance Manager / auditor

Design intent. Provide controlled financial operations, ledgers, reconciliations, tax, and budgets.

Workspace composition. Ledger navigator, account cards, reconciliation workspace, budget panels, journal review The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

Interaction contract. Primary actions are **Post journal; reconcile; approve; close period; export statement**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Accounts, journals, invoices, expenses, budgets, bank balances Forms center on **Account; date; debit; credit; cost centre; tax; period**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. Sales; Procurement; POS; Bank & MFI; Reports. Workflow: Source event → Journal → Approval → Posting → Reconciliation → Close.

SCREEN IDENTIFIER

24 · Integration Hub Purpose: Connect external services and monitor verified integration health.

Design intent. Connect external services and monitor verified integration health.

Workspace composition. Connection cards, credential form, webhook endpoint, test result, scopes The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

Interaction contract. Primary actions are **Add; rotate; test; disable; replay; inspect logs**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Providers, scopes, endpoints, signatures, delivery state Forms center on **Provider; base URL; secret; scope; event; retry policy**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. API integrations; Notifications; Workflow Studio. Workflow: Register → Authorize → Test → Activate → Monitor.

26 · Collaboration Hub Purpose: Coordinate chat, email, calendar, workspaces, files, and team

Design intent. Coordinate chat, email, calendar, workspaces, files, and team presence.

Workspace composition. Conversation list, channel composer, calendar, shared workspace, presence badges The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

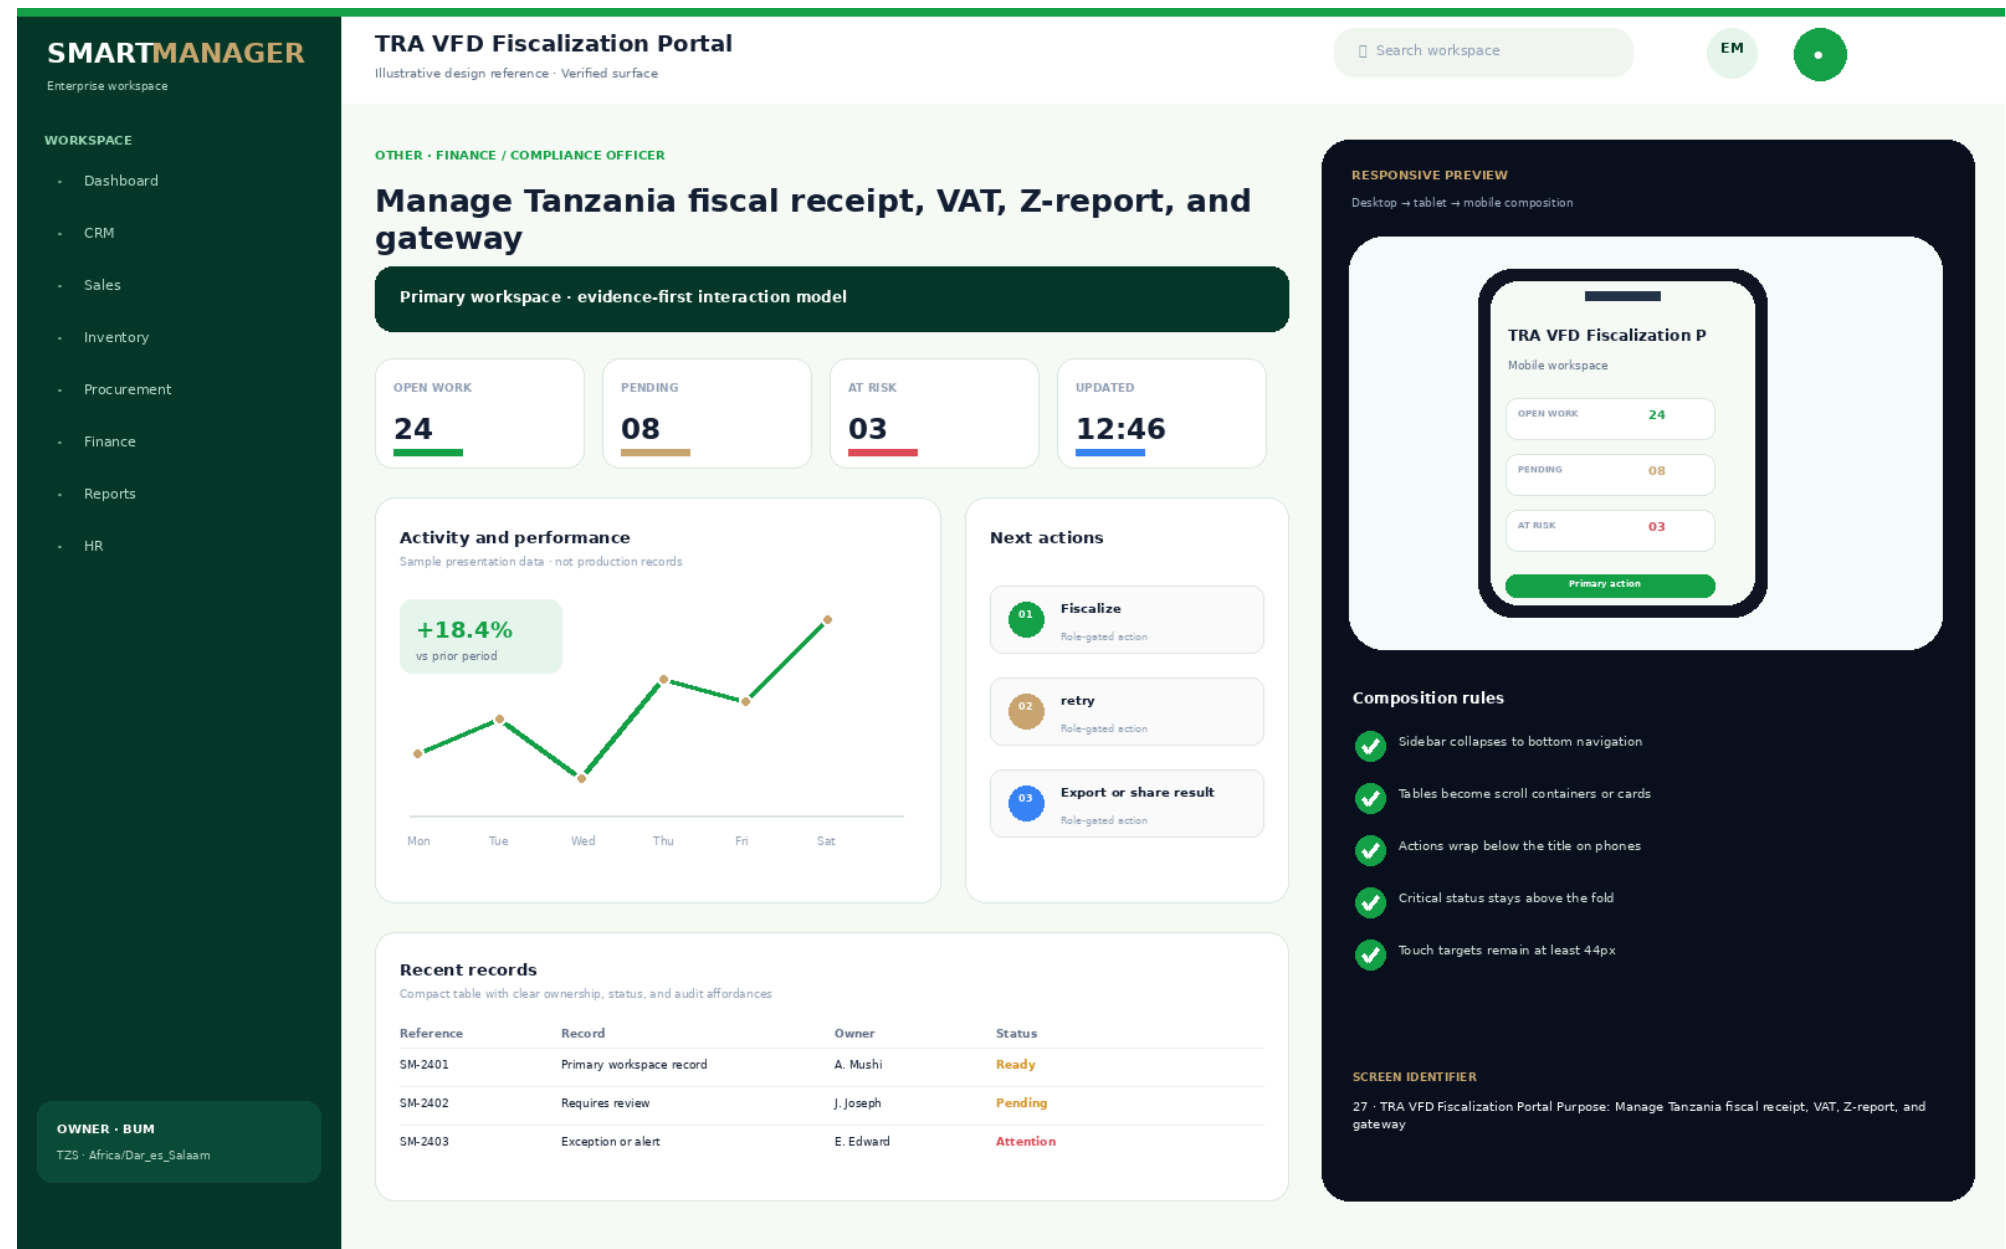

Interaction contract. Primary actions are **Message; schedule; share; mention; search**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Messages, channels, events, files, participants, presence Forms center on **Channel; recipient; message; attachment; meeting time**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. Support; Projects; Documents; Notifications. Workflow: Compose → Send → Deliver → Collaborate → Archive.

33 27 · TRA VFD Fiscalization Portal

other · primary role: Finance / compliance officer

Design intent. Manage Tanzania fiscal receipt, VAT, Z-report, and gateway evidence workflows.

Workspace composition. Fiscal dashboard, receipt queue, VAT return panel, Z-report card, gateway status The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

Interaction contract. Primary actions are **Fiscalize; retry; preview; export; submit; reconcile**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Receipts, tax lines, VAT returns, gateway responses, audit trail Forms center on **TIN; buyer; tax code; amount; device; period; status**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. Sales; POS; Finance; Reports. Workflow: Sale → Fiscalize → Confirm → Reconcile → Report.

37 · Banking & MFI Purpose: Operate accounts, deposits, withdrawals, credit, cash, reconciliation,

Design intent. Operate accounts, deposits, withdrawals, credit, cash, reconciliation, and financial controls.

Workspace composition. Account/customer registry, teller board, loan book, AML alerts, reconciliation The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

Interaction contract. Primary actions are **Open account; transact; approve; disburse; collect; reconcile**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Customers, KYC, accounts, journals, loans, cash, AML, audit Forms center on **Customer ID; KYC; account; amount; product; approval; reference**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. Microfinance; VICOBA; Finance; Accounting. Workflow: KYC → Account → Transaction → Approval → Settlement → Reconcile.

SCREEN IDENTIFIER

38 · Restaurant & F&B Purpose: Manage menu, table service, kitchen flow, bills, and settlement.

Design intent. Manage menu, table service, kitchen flow, bills, and settlement.

Workspace composition. Table map, order ticket, kitchen queue, bill panel, stock signal The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

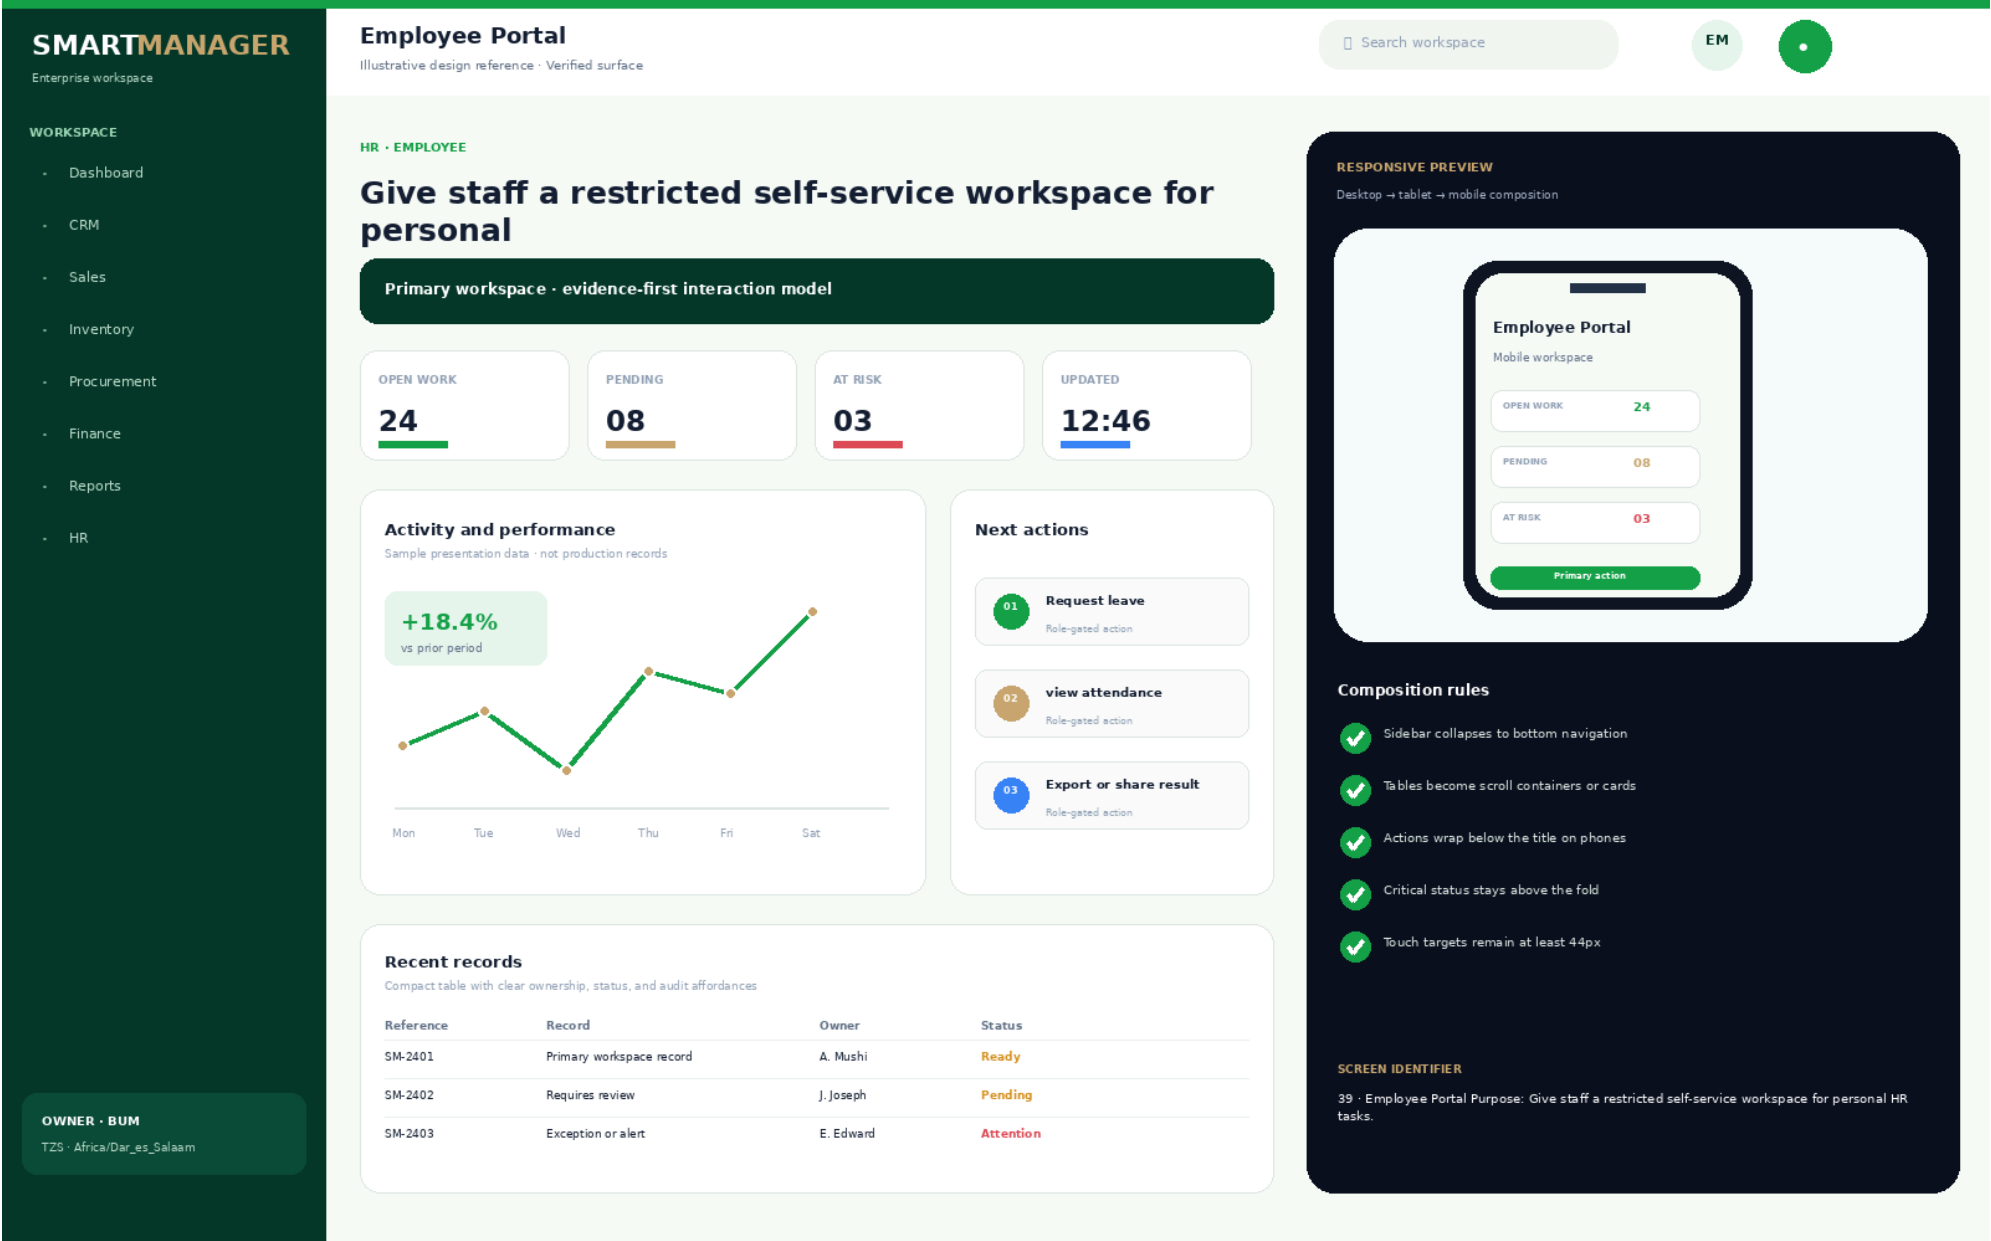

Interaction contract. Primary actions are **Open table; order; fire; serve; split bill; close**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Tables, orders, modifiers, kitchen states, bills, payments Forms center on **Table; items; modifiers; course; tender; status**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. POS; Inventory; Hotel; Finance. Workflow: Seat → Order → Kitchen → Serve → Bill → Close.

45 39 · Employee Portal

hr · primary role: Employee

Design intent. Give staff a restricted self-service workspace for personal HR tasks.

Workspace composition. Profile card, leave request, attendance, payslip/document panel, notices The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

Interaction contract. Primary actions are **Request leave; view attendance; update profile; read notice**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Own profile, leave, attendance, documents, approvals Forms center on **Dates; reason; contact; attachment; acknowledgement**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. HR; Documents; Notifications. Workflow: Open → View → Request → Approve → Notify.

SCREEN IDENTIFIER

40 · Enterprise Settings & Security Control Center Purpose: Configure company profile, branding,

Design intent. Configure company profile, branding, module entitlements, roles, integrations, and security evidence.

Workspace composition. Settings tabs, branding editor, role matrix, webhook controls, audit panels, preferences The composition uses a clear title/context band, compact status cards, a dominant evidence or activity panel, explicit next actions, and a responsive preview.

Interaction contract. Primary actions are **Save; upload; assign role; enable module; rotate key; export evidence**. The screen should preserve ownership, status, validation, audit, and related-record context before committing a change.

Data and fields. Company, profile, branding, entitlements, roles, webhooks, preferences Forms center on **Name; TIN; currency; timezone; logo; role; module; timeout**. Empty, loading, error, restricted, pending, and success states must be explicit.

Connected surfaces. Every module; Integration Hub; Audit. Workflow: Edit → Validate → Confirm → Persist → Audit → Propagate.

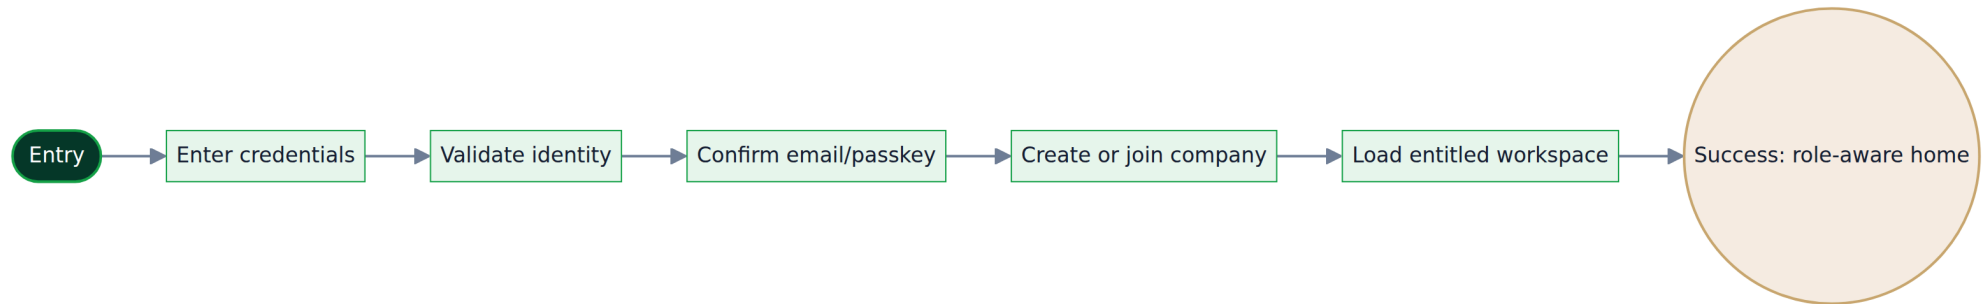

47 Critical workflow diagrams

The workflow pages identify validation, approval, persistence, evidence, and result boundaries

A workflow is complete only when its user intent, validation, authorization, persistence, resulting status, and recovery path are visible. The following diagrams are deliberately concise and are intended to be read alongside the module specifications and the existing backend contracts.

48 Authentication and onboarding

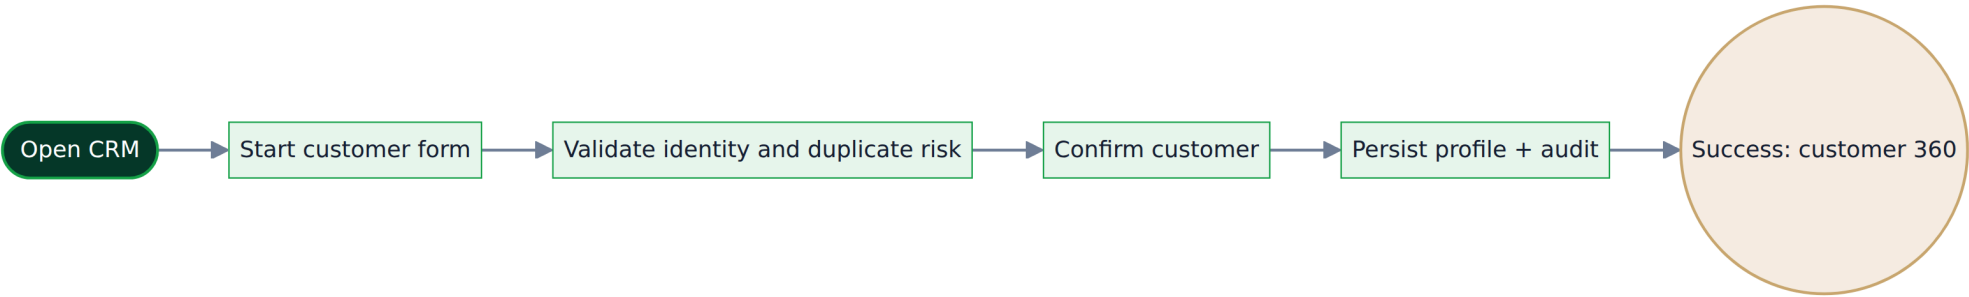

Safe entry, verification, company setup, and role-aware landing.

Senior review. Safe entry, verification, company setup, and role-aware landing. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

49 Customer creation

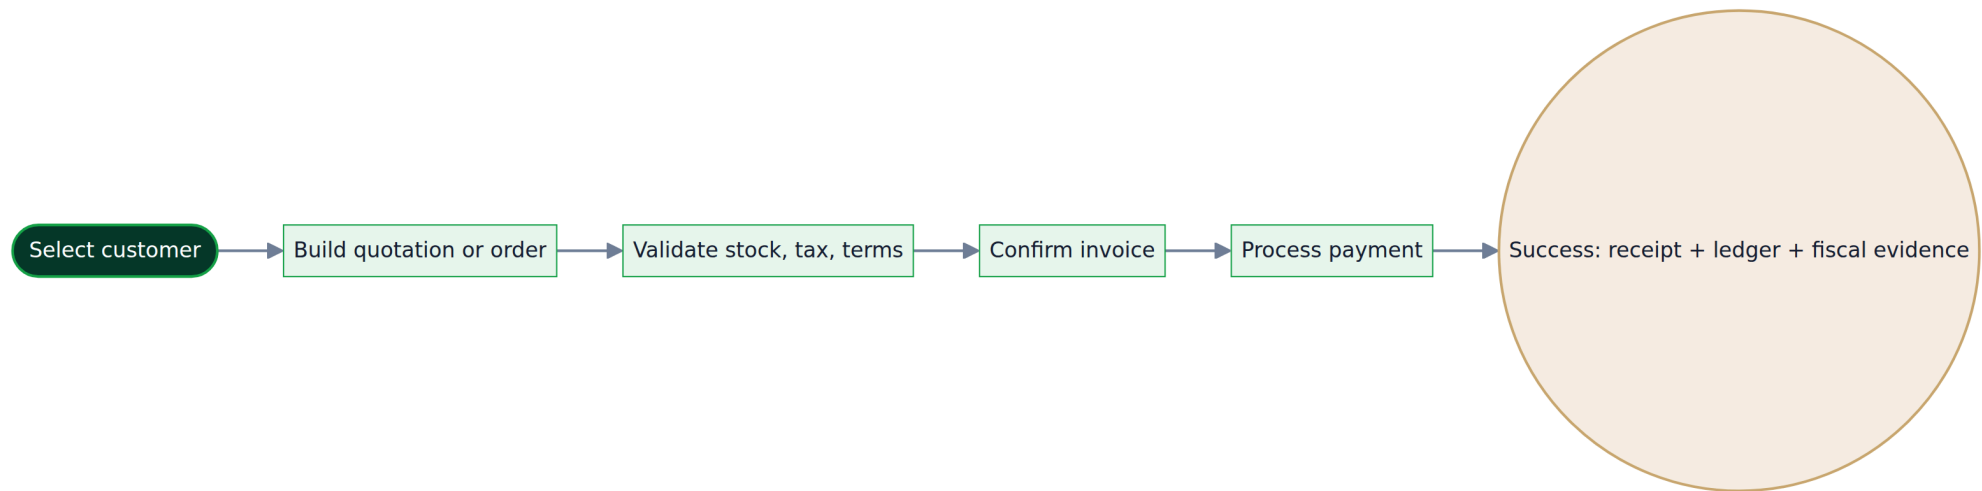

Identity validation and duplicate-risk controls before a customer record is persisted.

Senior review. Identity validation and duplicate-risk controls before a customer record is persisted. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

50 Sales to receipt

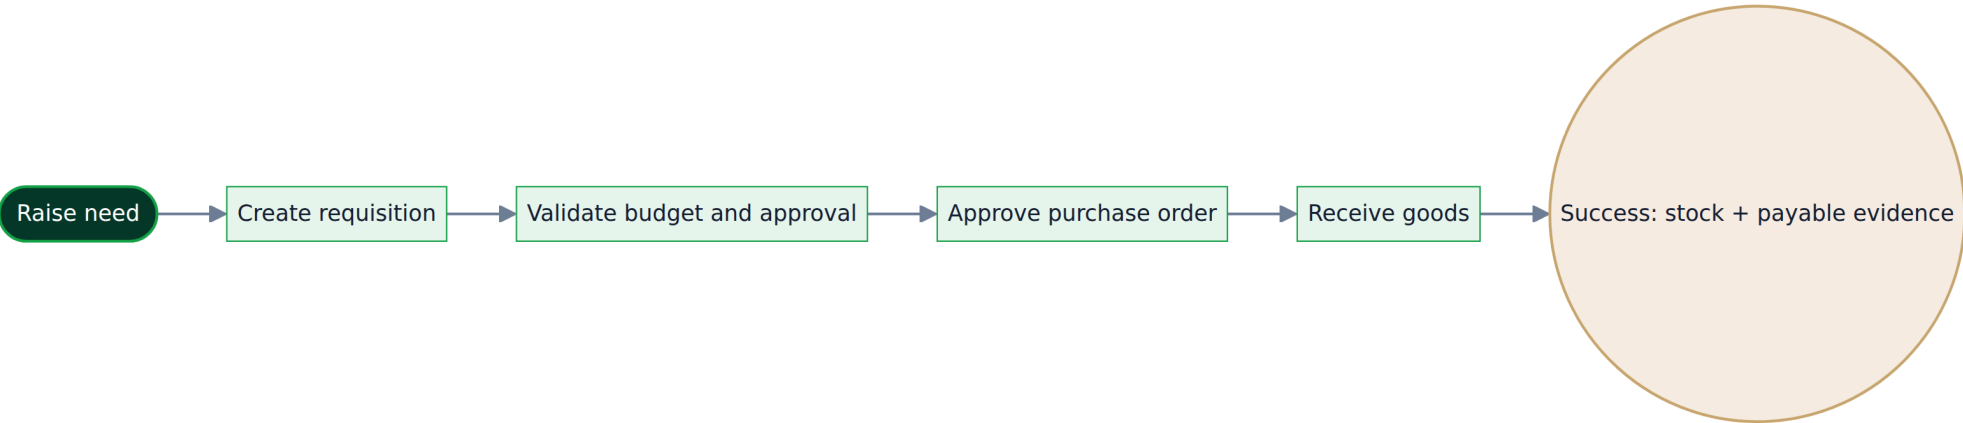

Order, invoice, payment, receipt, ledger, and fiscal evidence stay connected.

Senior review. Order, invoice, payment, receipt, ledger, and fiscal evidence stay connected. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

51 Procurement cycle

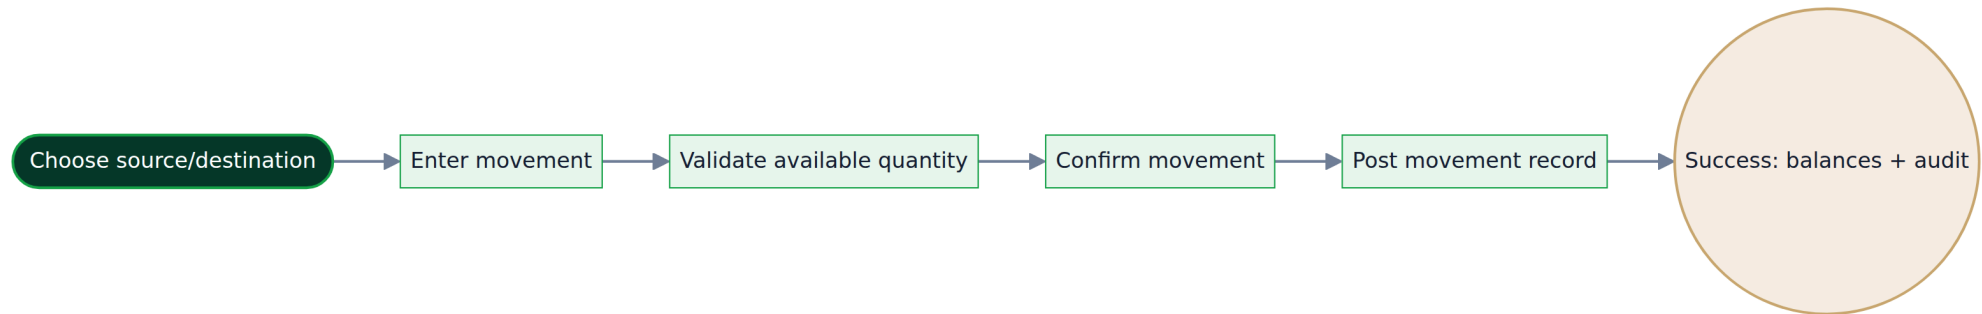

Budget validation, approval, receiving, and payable evidence are visible as one chain.

Senior review. Budget validation, approval, receiving, and payable evidence are visible as one chain. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

52 Inventory movement

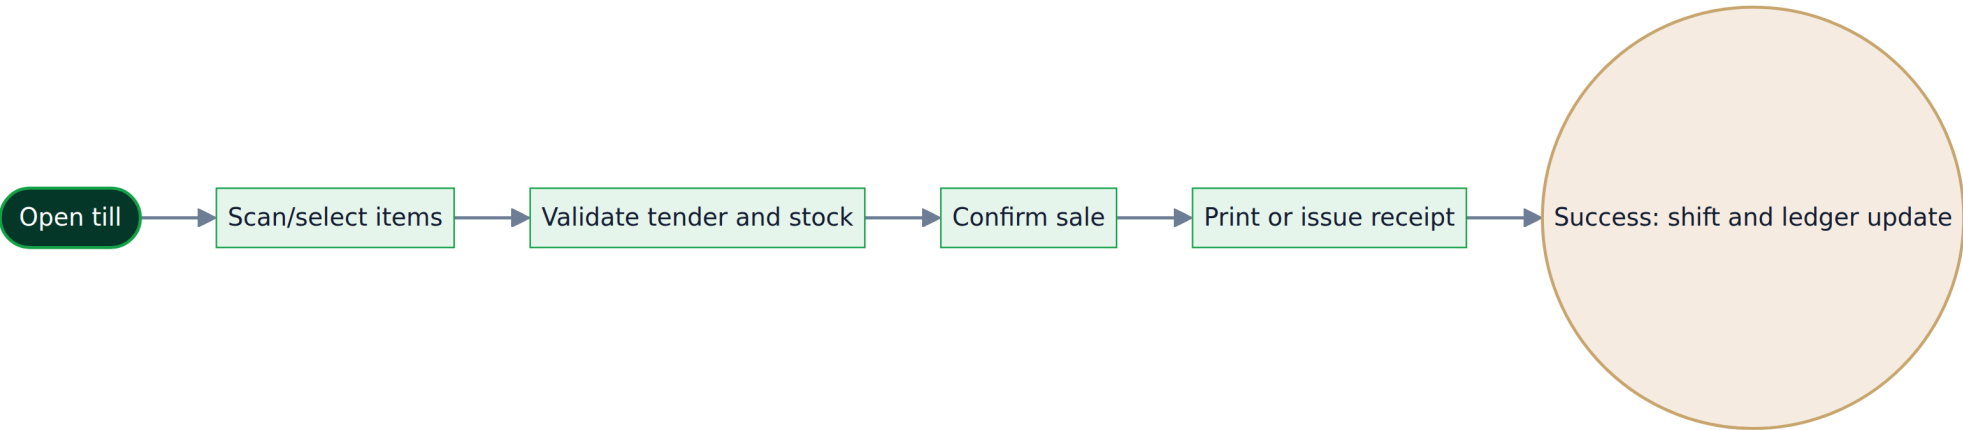

Available quantity and source/destination context are validated before movement.

Senior review. Available quantity and source/destination context are validated before movement. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

53 POS transaction

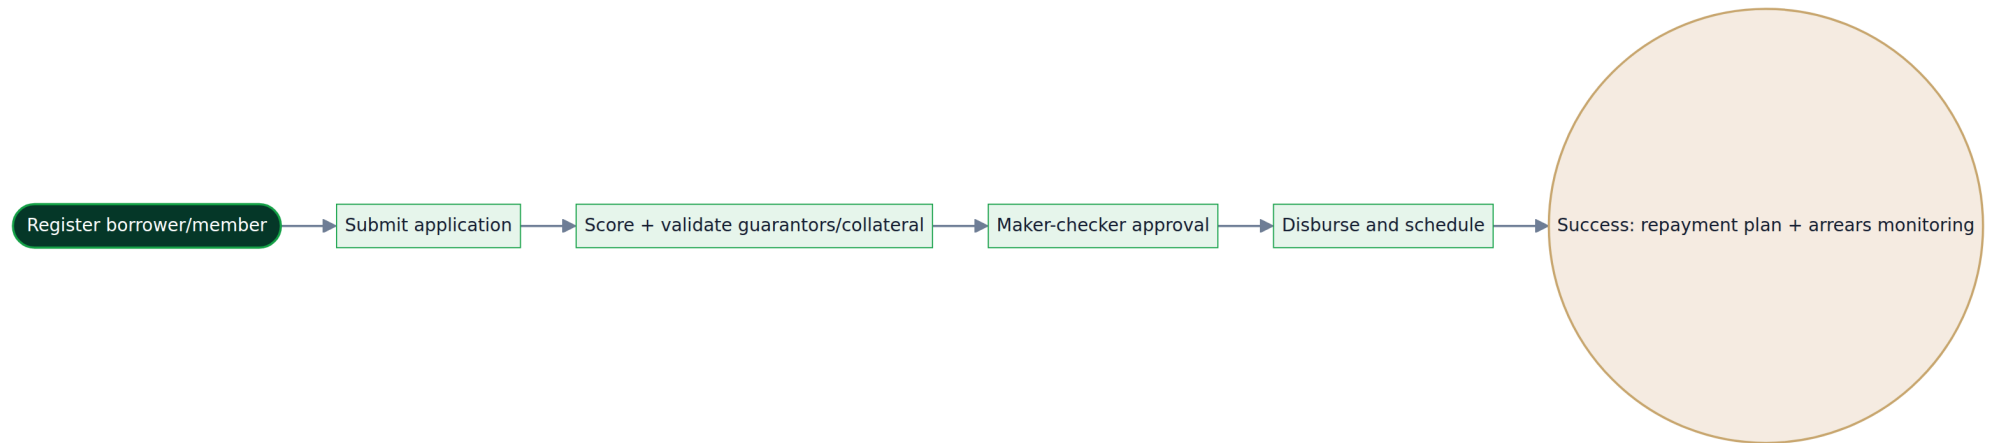

Fast cashier flow with tender validation, receipt evidence, and shift reconciliation.

Senior review. Fast cashier flow with tender validation, receipt evidence, and shift reconciliation. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

54 Loan lifecycle

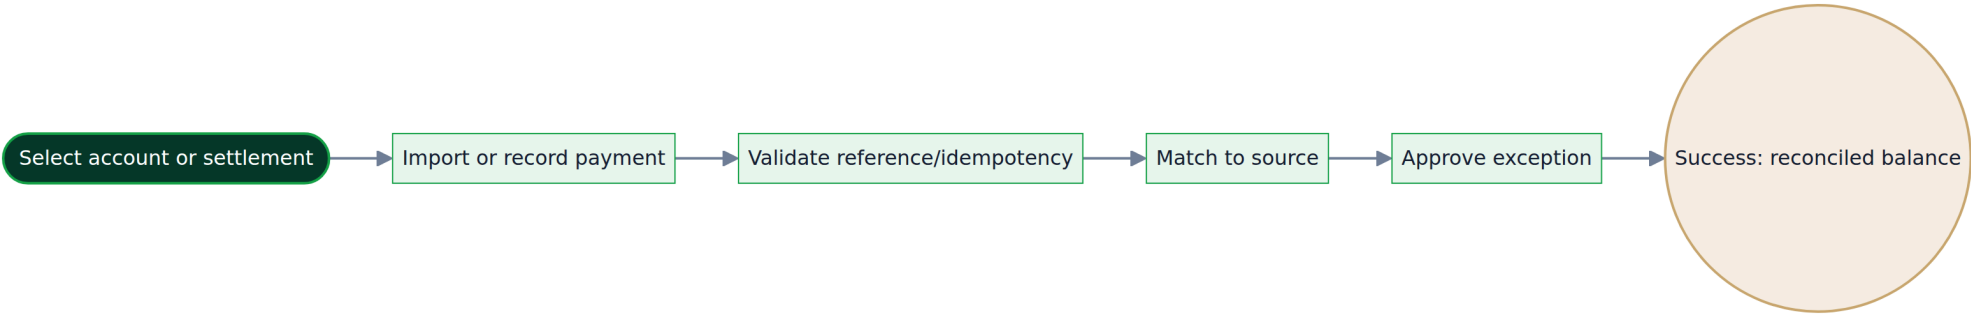

Credit, guarantor/collateral, maker-checker, disbursement, schedules, and arrears.

Senior review. Credit, guarantor/collateral, maker-checker, disbursement, schedules, and arrears. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

55 Payment reconciliation

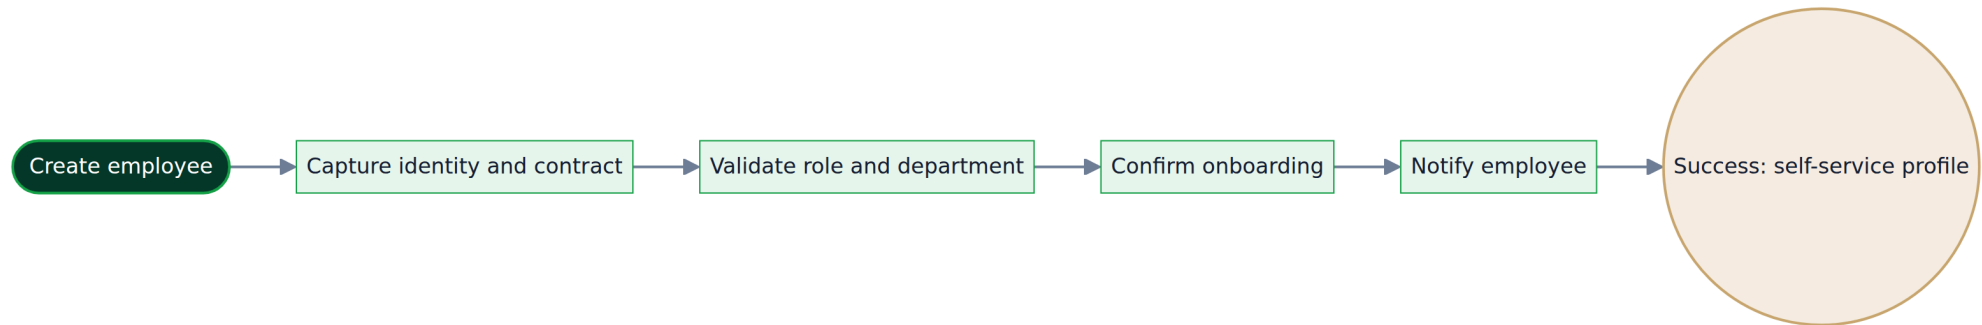

Reference/idempotency, matching, exceptions, and reconciled balances.

Senior review. Reference/idempotency, matching, exceptions, and reconciled balances. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

56 Employee onboarding

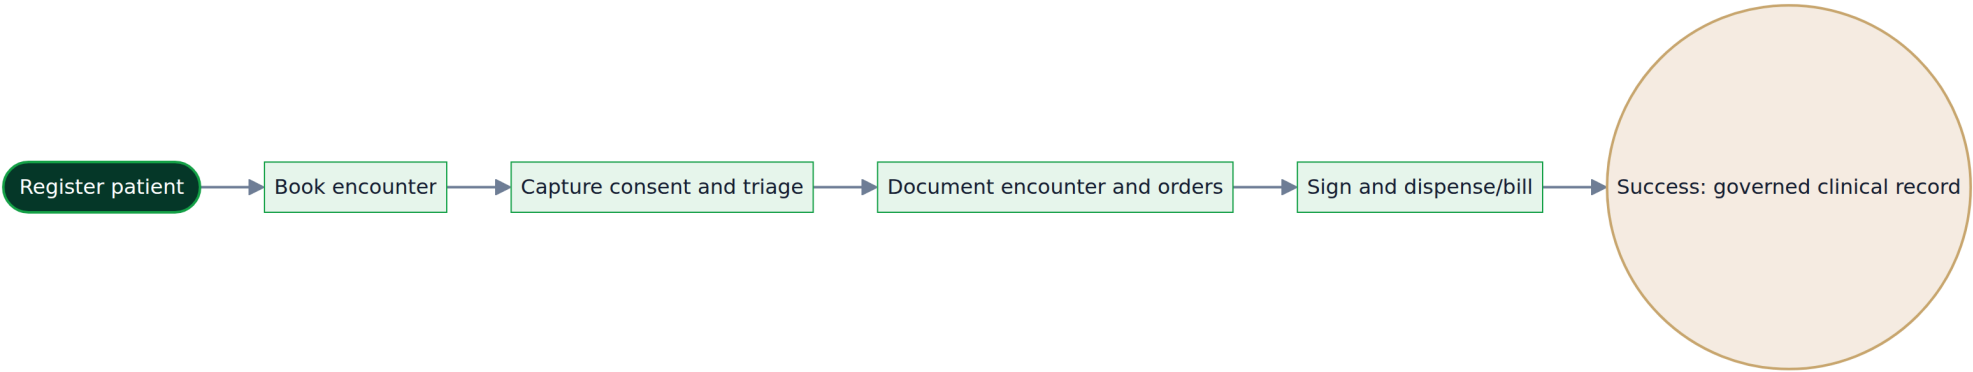

Identity, role, department, notification, and self-service handoff.

Senior review. Identity, role, department, notification, and self-service handoff. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

57 Healthcare patient journey

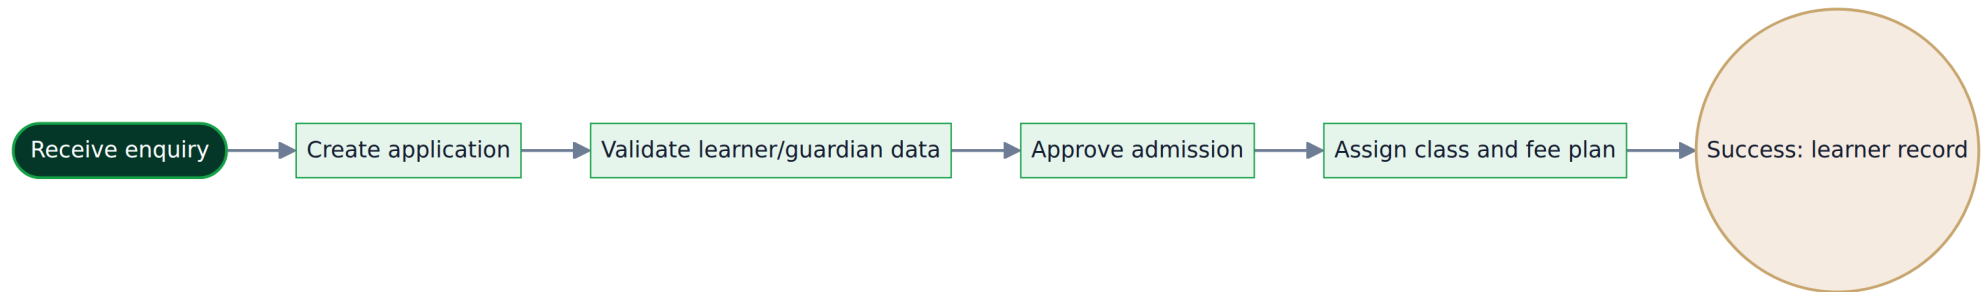

Consent, triage, encounter, orders, sign-off, dispensing, and billing boundaries.

Senior review. Consent, triage, encounter, orders, sign-off, dispensing, and billing boundaries. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

58 School admission

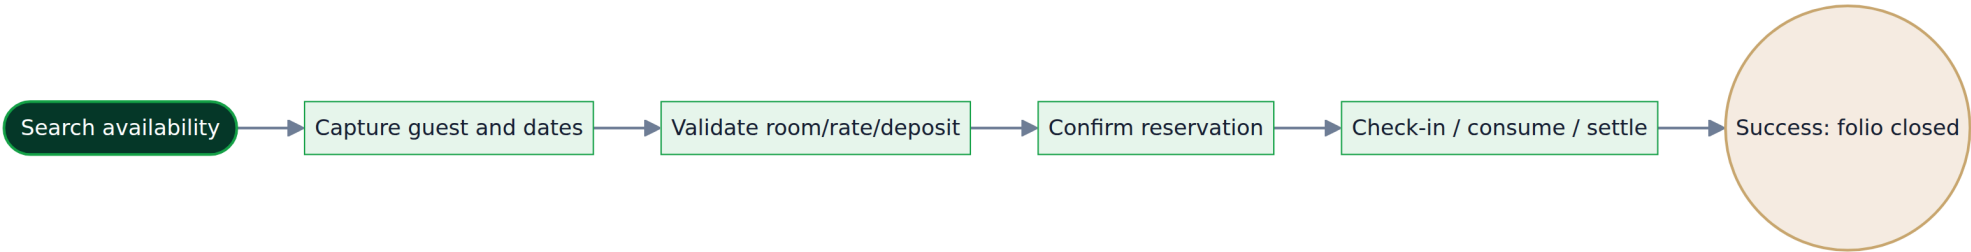

Application, guardian/learner validation, admission, class assignment, and fees.

Senior review. Application, guardian/learner validation, admission, class assignment, and fees. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

59 Hotel reservation

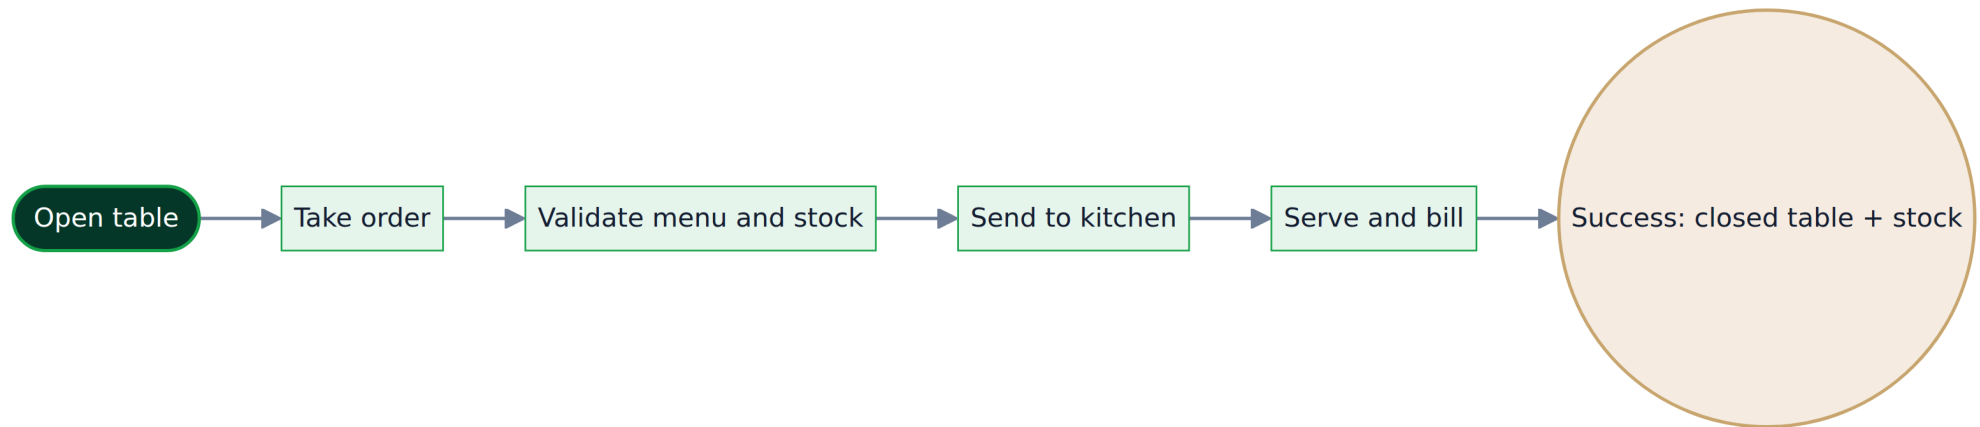

Availability, guest, deposit, reservation, folio consumption, and settlement.

Senior review. Availability, guest, deposit, reservation, folio consumption, and settlement. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

60 Restaurant order

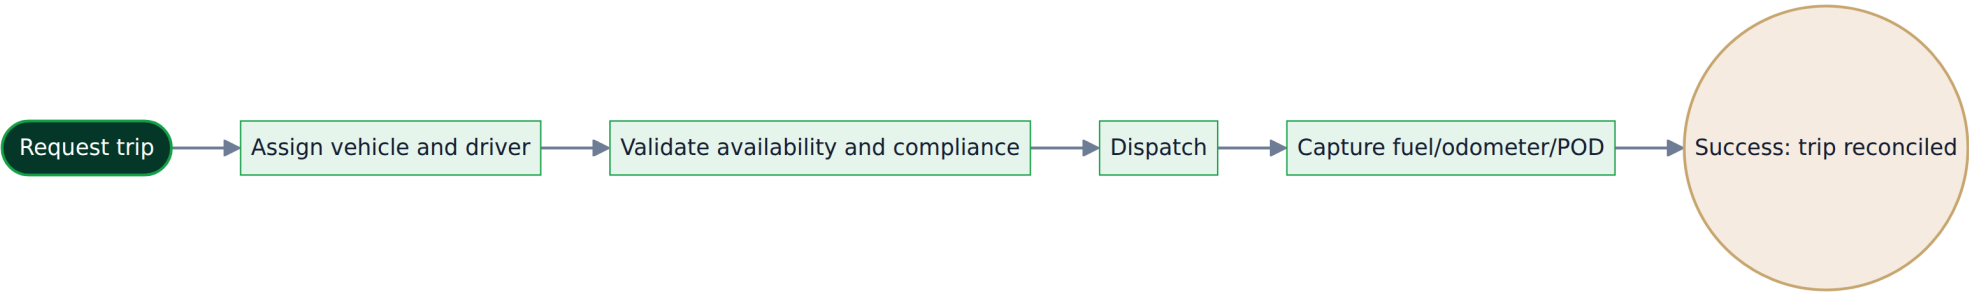

Table, menu, stock, kitchen, service, and bill closure.

Senior review. Table, menu, stock, kitchen, service, and bill closure. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

61 Fleet trip

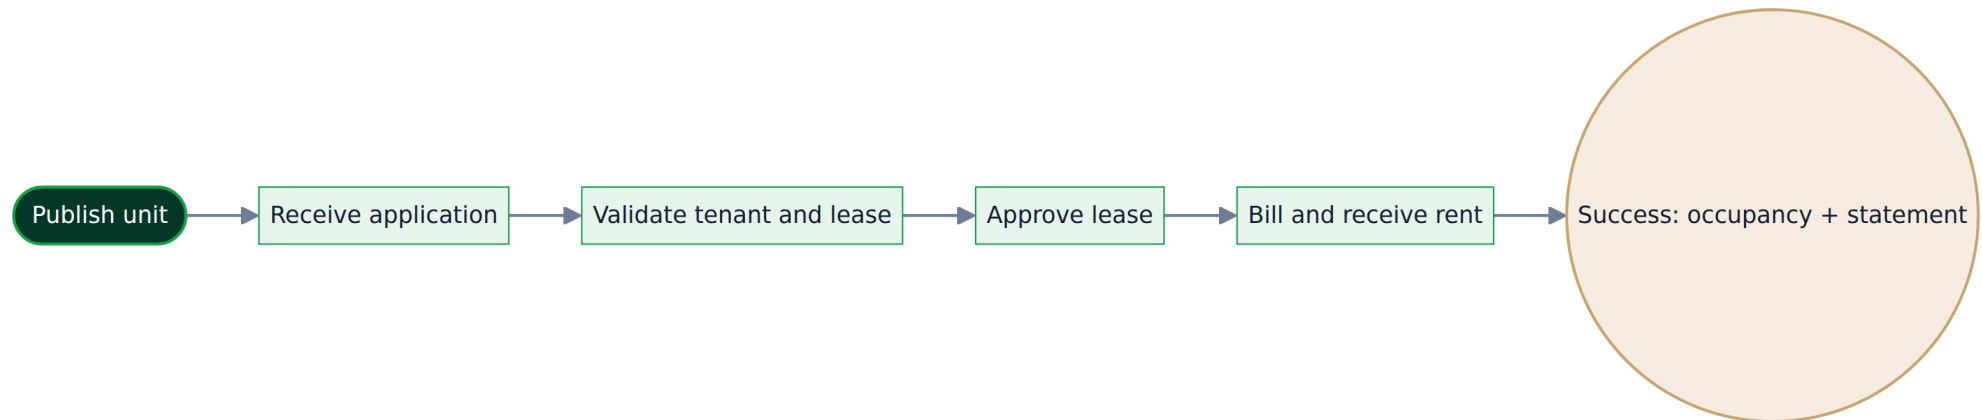

Vehicle/driver compliance, dispatch, evidence capture, and reconciliation.

Senior review. Vehicle/driver compliance, dispatch, evidence capture, and reconciliation. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

62 Property rental

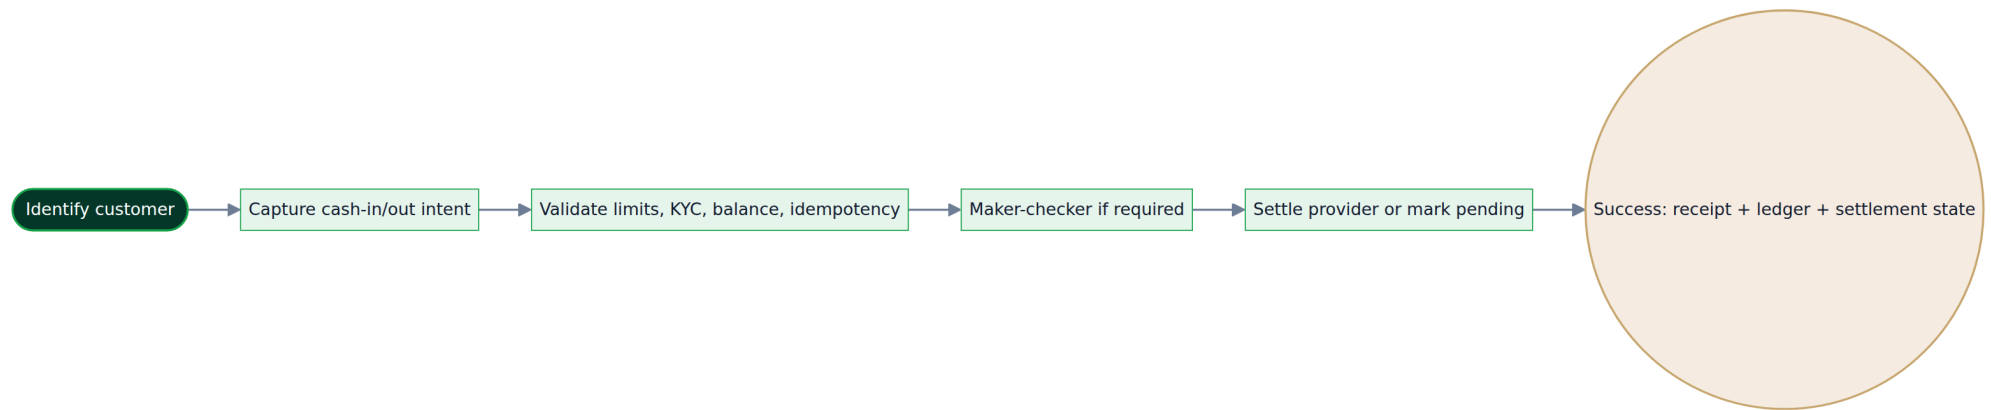

Unit, applicant, lease approval, billing, rent, occupancy, and statement.

Senior review. Unit, applicant, lease approval, billing, rent, occupancy, and statement. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

63 Money Agent transaction

KYC, limits, idempotency, maker-checker, provider state, ledger, and settlement.

Senior review. KYC, limits, idempotency, maker-checker, provider state, ledger, and settlement. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

64 VICوبا / SACCOS transaction

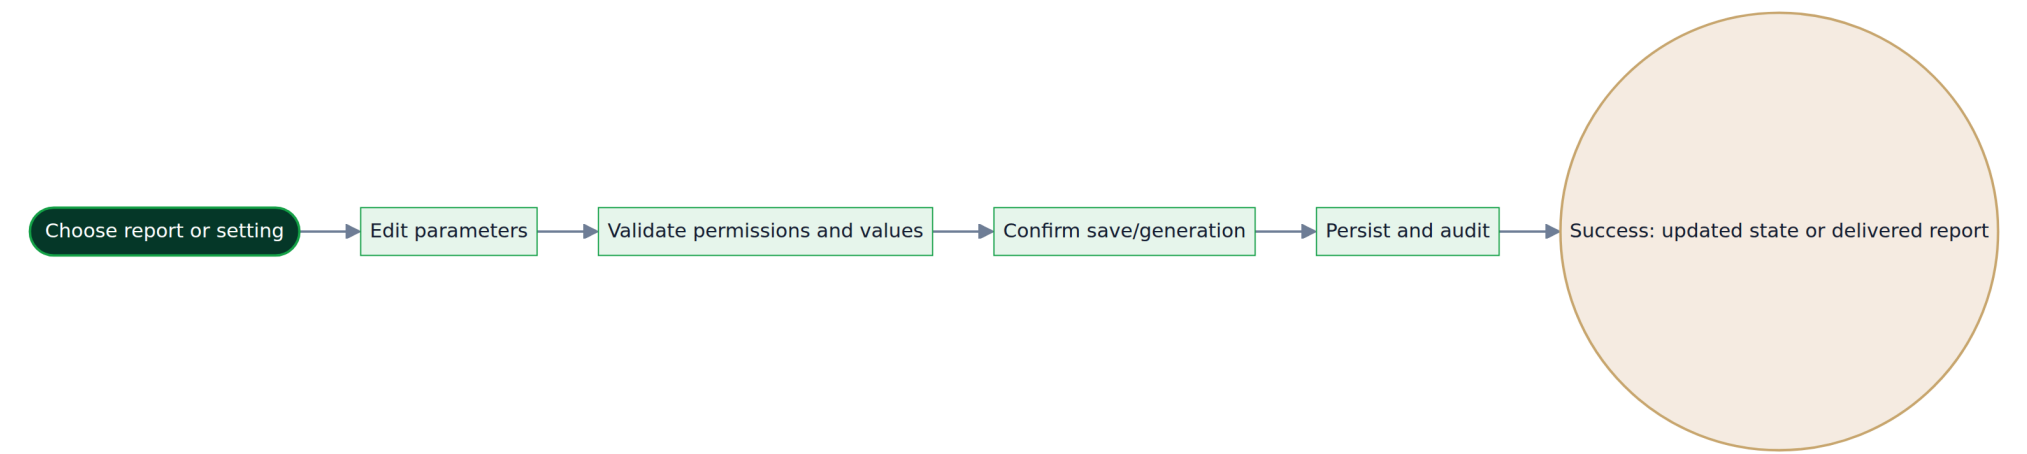

Meeting/member context, shares, savings, contributions, decisions, and cooperative balances.

Senior review. Meeting/member context, shares, savings, contributions, decisions, and cooperative balances. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

65 Reports and Settings

Parameter validation, permission checks, persistence, audit, and delivery.

Senior review. Parameter validation, permission checks, persistence, audit, and delivery. The implementation should persist the successful result, surface controlled error and restricted states, and preserve a traceable reference for subsequent reporting or audit.

66 Responsive implementation guidance

Desktop, tablet, and mobile are compositions, not scaled-down copies

| Device context | Recommended composition | High-risk considerations | |—|—|—| | Desktop $\geq 1024\text{px}$ | Persistent sidebar, two-column command center, wide tables, visible evidence panels. | Do not bury status or ownership in hover-only UI. | | Tablet $640\text{--}1023\text{px}$ | Collapsed sidebar, two-column KPI grid, drawers for secondary actions, intentional table scrolling. | Keep the primary action and current context visible during drawer transitions. | | Mobile $\leq 639\text{px}$ | Top bar, bottom navigation, stacked cards, wrapped actions, full-width forms, scrollable tables. | Preserve readable labels, 44px touch targets, confirmation dialogs, and the result state above the fold. |

Accessibility requires semantic headings, labelled inputs, visible focus rings, keyboard-reachable menus and dialogs, contrast that does not rely on color alone, aria-live for asynchronous results, reduced-motion support, and explicit recovery instructions. For clinical, financial, identity, and security workflows, confirmation and audit evidence must remain accessible in keyboard and touch flows.

67 Settings and administration design

Settings is an operating control center, not a decorative preferences page

The current Settings surface combines company profile, branding, tax and timezone context, receipt configuration, industry focus, role changes, module entitlements, market-provider governance, webhook configuration, push-delivery history, dashboard preferences, security/authentication controls, and audit evidence. The visual design should group these by responsibility so that company identity is not mixed with secrets, and personal preferences are not confused with tenant policy.

| Settings area | Owner | Persistence expectation | |—|—| | Company profile and branding | Organization Owner / Super Administrator | Persist to the company/workspace record and audit meaningful changes. | | Module entitlements and role changes | Organization Owner / Super Administrator | Validate against server-side permission rules and record an approval/audit event. | | Market providers and webhooks | Authorized administrator | Store credentials server-side, redact secrets in responses, test before activation, record delivery outcomes. | | Dashboard preferences | Authenticated user | Persist per user and tenant; keep preview-only local fallback isolated from production state. | | Security and audit | Administrator / Auditor | Show effective state, recent events, and recovery or escalation paths. |

68 Implementation handoff

How to use this package without replacing the production application

The package is intended to guide incremental implementation. First use the screen inventory to confirm that a planned feature has a dedicated surface and role contract. Then use the relevant workflow page to define the query, mutation, validation, and result boundaries. Finally, implement the screen using the existing shared components, tRPC composition, verified-profile boundary, Supabase/RLS persistence, and current module route rather than creating a disconnected demo.

For each production change, follow this sequence: **inspect source and live data boundary** → **design state and permission contract** → **add or extend persistence additively** → **expose a protected server procedure** → **connect the UI** → **test validation and error states** → **run type/build/regression checks** → **inspect the live deployment**. Financial, cooperative, clinical, and external-integration actions require special attention to idempotency, concurrency, maker-checker approval, auditability, and explicit pending provider states.

68.1 Package contents

The companion archive contains the 40 module mockups, 18 workflow diagrams, editable Mermaid sources, inventory CSV/JSON, module-by-module design specifications, navigation and role documentation, responsive/accessibility guidance, visual QA notes, and this master PDF source project.
